Delphi XE2 Live Bindings

Data Binding for FireMonkey
 and VCL

Binding Expression Engine

- Binds
 - Concrete Delphi Objects
 - Scripted text
- Complex:
 - Probably the most complex feature added in recent Delphi versions
 - Might even 'beat' generics in complexity
- This session focuses on
 - Some fundamentals
 - Practical use in your Delphi applications:
Lots of examples

First some theory

Followed by lots of examples

The big picture

- Binding facilitates the communication between TComponents
 - Because of the Observer Pattern implementation there
 - See diff of the Classes unit
- The expressions are text based
 - Which makes it very flexible
 - But no compile time verification

Design time versus code-time

- | | |
|---|--|
| <ul style="list-style-type: none">• DesignTime<ul style="list-style-type: none">– TBindingList<ul style="list-style-type: none">• Lots of bindings• Methods<ul style="list-style-type: none">– Extendible• OutputConverters<ul style="list-style-type: none">– Extendible– Automatically applied– TBindingScope<ul style="list-style-type: none">• Binds to DB | <ul style="list-style-type: none">• Code time<ul style="list-style-type: none">– Expressions<ul style="list-style-type: none">• Scope– Bindings– Notification |
|---|--|

Central hub 1: TBindingExpression

- Has
 - Scope
 - Expression text
- Compiles
 - TComponent references (having 'instance' and 'name')
 - TAssociations (each coupling 'TObject' instance' and 'name')
 - IScopes
- Evaluates
 - The expression text

Central hub 2: TBindingManager

- The BindingManager manages notifications of affected objects
 - Requires the use of Managed bindings
 - i.e. Expressions, and not Unmanaged bindings like BindLink
 - Makes life much easier when using them programmatically
 - Unmanaged bindings are usually better at design time
- <http://docwiki.embarcadero.com/VCL/en/System.Bindings.Manager.TBindingManager>

Binding Basics

- **TBindingList**
 - Has Bindings of types:
 - Expressions
 - TBindExpression **
 - TBindExprItems *
 - Links
 - TBindLink *
 - TBindListLink *
 - TBindGridLink
 - TBindPosition
 - Lists
 - TBindList *
 - TBindGridList

- DB Links
 - TBindDBEditLink
 - TBindDBTextLink
 - TBindDBImageLink
 - TBindDBMemoLink
 - TBindDBCheckLink

- * have these properties:
 - ClearExpressions *
 - FormatExpressions *
 - ParseExpressions *
- ** have these properties:
 - ControlExpression
 - SourceExpression

TBindingExpression

- **Properties**
 - SourceComponent -> Source Scope
 - SourceExpression
 - ControlComponent -> Control Scope
 - ControlExpression
 - Direction (diSourceToControl, diControlToSource, diBiDirectional)

- Example: ManagedBindingEdits
- Edit1/Edit2 are bound: Source/Control
- Expressions both are Text
- Notification trigger is the OnChange event (it is programmed!!!)
- Steps:
 - Set Direction
 - Check Active
 - Type Text in Edit1 and Edit2

Components overview

- **TBindingList**
 - has Binding Components (TBind....)
 - Each can refer to Scope Components
- **TBindingNavigator (FMX)**
- **TBindScopeDB**
- **TBindNavigator**
- All of them have great design time support: property editors and wizards
- **Binding components**
 - TBindPosition
 - TBindList
 - TBindLink
 - TBindGridLink
 - ...
- **FireMonkey specific binding (as this is the only way to bind in FMX):**

Infrastructure:

- **Two roles are supported**
 - Editors of data
 - Observers of data
- **You can mix the roles if you want**

LiveBindings design time

- TBindingList
- Properties
 - Methods
 - Converters
- Methods
 - Notify
- Events
- Design time
 - Methods Editor (can locally disable global methods)
 - OutputConverters Editor (can locally disable global output converters)
 - Binding Components List Editor
 - similar to actionslist editor
 - only shows TBind... components that are relevant to your kind of (FMX/VCL) form
- Edit1Change
 - BindingList1.Notify(Sender, ""); // notify all managed bindings for Sender
 - BindingList1.Notify(Edit1, 'Text'); // notify Text bindings for Edit1

TBind... components

- all have
 - 1+ expression bindings
 - Active property
 - AutoActivate property
 - SourceComponent/ControlComponent
 - some:
SourceExpression/ControlExpression
 - Expression editor (except TBindDB*)

TBind* component purposes

- TBindExpression/TBindExprItems
 - Both create *managed* or unmanaged bindings for assigning values
- TBindPosition
 - Link a property in a control to the position of a data source
- TBindList, TBindGridList (TBind*List)
 - Unmanaged bindings to populate a list/grid
- TBindLink
 - Unmanaged bindings to link a control to a data source
 - for instance to behave like a TDBEdit/TDBImage in VCL
- TBindListLink, TBindGridLink
 - Unmanaged bindings to link a list or grid to a data source
 - For TStringGrid to behave like TDBGrid

TBindDB*Link

- Edit, Text, List, Image, Memo, Check, Grid
- Unmanaged bindings to link FMX controls to a data source
- Demo: OneEachForm.dproj

TBindExpression additional properties

- Direction
- Managed
- NotifyOutputs
- SourceExpression/ControlExpression
- has Expression editor
- Expression editor has test buttons (Eval*)

TBindExprItems

- Similar to TBindExpressions
 - supports multiple expression strings
 - handy when updating more controls for one source
 - or more controls from multiple sources in one place
- Different properties:
 - ClearExpressions
 - FormatExpressions (not: ControlExpression)
 - NotifyOutputs
 - SourceMemberName (not: SourceExpression)

TBindPosition

- Different properties:
 - PosClearExpressions
 - Executes when the TBindPosition is deactivated
 - PosControlExpressions (not: ControlExpression)
 - From Source to Control
 - for ScrollBar: Self.Max (RecordCount-1), Position (Max(0, RecNo-1)), Hint ("Record " + ToStr(RecNo) + "of " + ToStr(RecordCount))
 - PosSourceExpressions
 - from Control to Source
 - for ScrollBar: RecNo <- Position+1
 - SourceMemberName (not: SourceExpression)

TBindList

- Different Properties:
 - AutoFill
 - BufferCount
 - ClearControlExpressions -> for the ListBox
 - FormatControlExpressions -> for the ListBox
 - FormatExpressions -> for the Items in the ListBox
 - SourceMemberName (not: SourceExpression)
 - FormatExpression example: Text <- ToStr(RecNo) + ". " + Name.AsString + " (" + Weight.AsString + " pounds.)"
- Buttons in property editor.
- Commands in object inspector: Fill List; Clear List.

TBindGridList

- Properties:
 - AutoFill
 - BufferCount
 - ClearControlExpressions
 - ColumnExpressions
 - FormatControlExpressions
 - FormatExpressions
 - SourceMemberName (not: SourceExpression)
- Commands in object inspector: Fill Grid, Clear Grid
- ColumnExpressions are a lot of work to fill in.
- It consists of a Column, and for each column the formatting expressions.

TBindGridList (continued)

- Each Column has these properties:
 - ColumnIndex
 - ColumnName
 - ControlMemberName
 - FormatCellExpressions
 - (each having a ControlExpression and SourceExpression
Cells[2] <- AsString + 'lbs')
 - FormatColumnExpressions (idem Cell[2, 0] <- FieldName)
 - Name
 - SourceMemberName
- FireMonkey has a live bindings component that does not require you to write expressions.
- In VCL you can also use code to fill the properties.

TBindLink (bi-directional!)

- ClearExpressions
- FormatExpressions (not: ControlExpression)
- ParseExpressions
- SourceMemberName (not: SourceExpression)

TBindListLink combines: TBindLink, TBindList, TBindPosition

- Properties:
 - AutoFill
 - BufferCount
 - ClearControlExpressions
 - FormatControlExpressions
 - FormatExpressions
 - ParseExpressions
 - PosControlExpressions (not: ControlExpression)
 - PosSourceExpressions
 - SourceMemberName (not: SourceExpression)
- populates ListBox
- current row in ListBox because of Navigation
- updates from Edit to Field in DataSet
- Demo:
 - FormatExpressions[0]: Text <- Name.AsString + " - Weight: " + Weight.AsString + " pounds."

TBindGridLink

- like TBindGridList but adds Positioning support and Parse expressions for bidirectional support
 - AutoFill
 - BufferCount
 - ClearControlExpressions
 - ColumnExpressions
 - FormatControlExpressions
 - FormatExpressions
 - ParseExpressions
 - PosControlExpressions (not: ControlExpression)
 - PosSourceExpressions
 - SourceMemberName (not: SourceExpression)

TBindGridLink

- Each Column has these properties:
 - ColumnIndex
 - ColumnName
 - ControlMemberName
 - FormatCellExpressions
 - (each having a ControlExpression and SourceExpression
- Cells[2] <- AsString + 'lbs')

Drawback of Data Binding

- no support for data validation like TDB* components have.

FireMonkey FMX – more components: better support

- TBindDB*Link
 - Edit
 - Text
 - List
 - Image
 - Memo
 - Check
 - Grid
 - TBindDBEditLink
 - TBindDBTextLink
 - TBindDBListLink
 - TBindDBImageLink
 - TBindDBMemoLink
 - TBindDBCheckLink
 - TBindDBGridLink
- They all have "embedded" expressions: not in the object inspector, and not editable in the TBindLink editor
- They all use a TBindLink internally
 - except for TBindDBGridLink which uses a TBindGridLink internally.

SimpleDBBindLinkProject: FMX

- TBindNavigator: FMX
- - BindScope property:
TBindScopeDB1

Scope Components

- - Wrap a TObject in s a scope for the expression engine
- - May be referenced by the SourceComponent property of abinding component
- - May implement one or more IScope* interfaces to specialize

Interesting Examples

- EvalErrorSample
 - Shows that binding is about Source and Control expressions
- BindExpressionSampleProject
 - Shows binding of "Text" property from a single component
- fmx\BindListFMXProject.dpr, vcl\BindListVCLProject.dpr
 - <http://blogs.embarcadero.com/jimtierney/2011/09/30/31559>
 - Show BindingList feature: DB to ListBox
- ListCollectionsSampleProject
 - Shows binding to a couple of kinds of collections
 - <http://blogs.embarcadero.com/jimtierney/2011/10/14/31608>
 - <http://blogs.embarcadero.com/jimtierney/2011/09/30/31559>
 - SimpleListCollectionSampleProject, ListCollectionsSampleProject
 - BindListFMXProject, BindListVCLProject
- BindListEditVCLProject
 - Using BindingList with expressions, Binds
 - an Edit to/from a ListBox and
 - an Edit to/from a ListView

Write an application

- Two input fields that have bidirectional copying
- Write a small application that has a TBindingExpression
 - Use it for doing some basic calculations
 - Enter the expression in Edit1
 - Show the results in Memo1
